CS171 Midterm Exam Review

The exam will be conceptual, and may cover materials from the textbook, lecture notes, quizzes, and assignments. Below is a review of the key topics.

Java and OO
- Object type variables vs. primitive type variables
- Methods, overloading, call stack
- Local variables vs. Parameter variables vs. Instance variables
- Inheritance, overriding, polymorphism
- Interface, Comparable
- Generics
- Iterators

Arrays
- Typical array processing and traversal
- Binary search for ordered arrays – algorithm, implementations (loop-based version and recursive version), and cost analysis

Linked lists
- Linked lists vs. array
- Insert, search, delete – implementations and cost
- Variations - double-ended list, doubly-linked list, circular list

Stacks and queues
- Basic operations: push and pop for stacks; enqueue and dequeue for queues
- Implementations using resizing arrays and linked list
- Priority queues, Deques

Algorithm analysis
- Big O notation
- Common functions - constant, logarithm, linear, quadratic, polynomial, exponential, factorial in increasing order of growth
- loop analysis, cost analysis using recurrence relations

Sorting
- Bubble sort, selection sort, and insertion sort – algorithms, implementations, and cost analysis
- Mergesort – algorithms, implementations, and cost analysis
